

Global alignment update

Nils Breer

19. März 2024

TU Dortmund, AG Albrecht

Tested various configurations for aligning the VELO and the SciFi together VELO halves always aligned in "TxTyTz"; SciFi aligned in "TxRz(Rx)"

Here: Reconstruction sequence from the SciFi is used

Joint constraints used everywhere and set a very small Rx survey uncertainty constrain readout side to nominal position of the C-Frame

example called 'v1' here

```
configureGlobalAlignment(halfdofs="TxTyTzRy"):
setup = AlignmentScenario('GlobalAlignment')
setup.SubDetectors += ['VP', 'FT']
elements = Alignables()
elements.VP("None")
elements.VPRight(halfdofs)
elements.VPLeft(halfdofs)
elements.FTHalfModules("TxRxRz")
setup.Elements += list(elements)
surveyconstraints = SurveyConstraints()
if UseDD4Hep:
   surveyconstraints.VP(ver='2023_dd4hep')
   surveyconstraints.FT(addHalfModuleJoints=True)
    surveyconstraints.VP(ver='latest')
setup.SurveyConstraints = surveyconstraints
constraints = []
constraints.append("VPHalfAverage : .*?VP(Left|Right) : Tx Ty Tz Ry")
constraints.append("FTBackFramesFixed : FT/T3/X2/HL.*/M. : Tx Rz")
setup.LagrangeConstraints = constraints
return setup
```

Alignment configurations

v1: SciFi (TxRxRz), no SciFi survey

v2: SciFi (TxRz), no SciFi survey

v3: SciFi (TxRz), SciFi C-Frames survey

v4: SciFi (TxRz), SciFi C-Frames survey, constrain (U|V) layer in T2 for Tx Rz

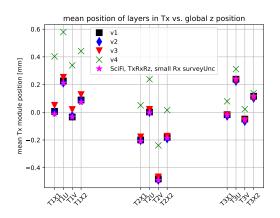

N.Breer | 19. März 2024 3 / 15

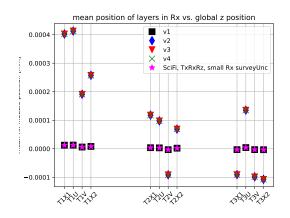

Global alignment: Tx, Rx vs global z position

mean Tx in [mm], Rx in [rad] of each layer

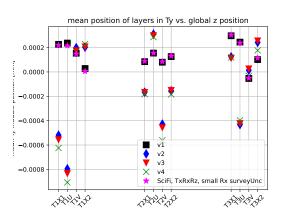

N.Breer | 19. März 2024 4 / 15

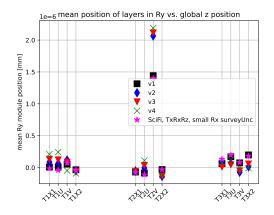

Global alignment: Ty, Ry vs global z position

mean Ty in [mm], Ry in [rad] of each layer

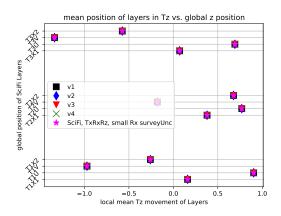

N.Breer | 19. März 2024 5 / 15

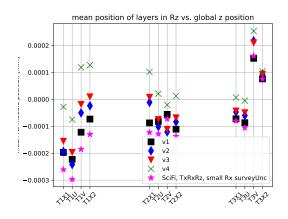

Global alignment: Tz, Rz vs global z position

mean Tz in [mm], Rz in [rad] of each layer

N.Breer | 19. März 2024 6 / 15

without aligning Rx there will be a non-zero Rx; maximum 0.4 mrad visible but small z-rotation across stations

Tx constraint in v4 shifted everything closer to zero but didn't solve the problem for Tx behaviour

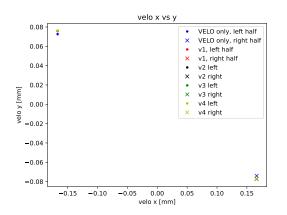

Ty worse when NOT aligning for Rx →joint constraint or C-Frame survey cannot correct for that

N.Breer | 19. März 2024 7/15

Comparison VELO only vs global constants

dots: left velo half; crosses: right velo half $v1 \rightarrow v4$ nearly identical (on top of each other)

difference between VELO only and from the global alignment: 3.5 μm

 \rightarrow is this withing the VELO acceptance or is 3.5 μm problematic?

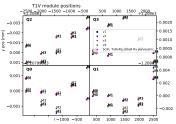

N.Breer | 19. März 2024 8 / 15

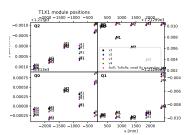

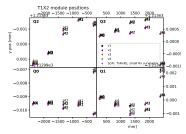

T1 SciFi module constants in global: x vs y

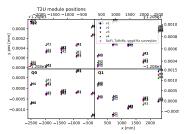

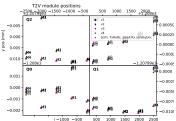

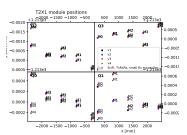

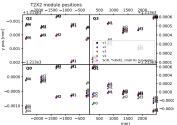

T2 SciFi module constants in global: x vs y

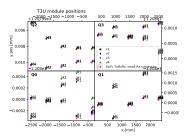

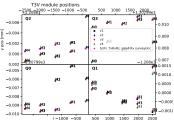

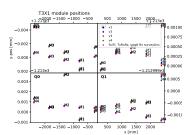

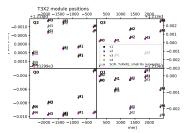

T3 SciFi module constants in global: x vs y

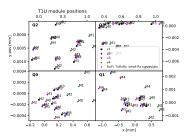

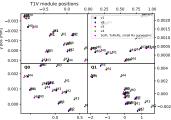

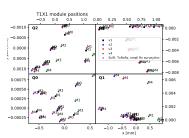

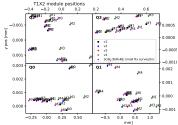

T1 SciFi module constants in local: x vs y

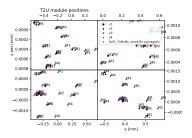

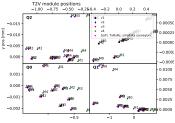

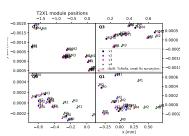

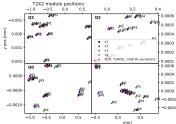

T2 SciFi module constants in local: x vs y

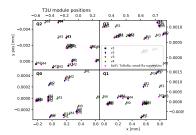

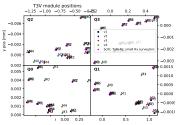

N.Breer | 19. März 2024

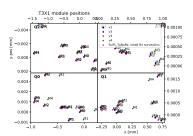

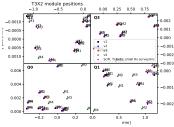

T3 SciFi module constants in local: x vs y

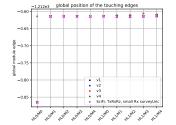

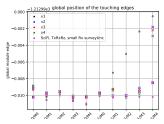

module edge difference in y direction

dots: middle edge of top half module, cross: middle edge of bottom half module

joints uncertainties: 0.01 0.0012 0.0019 0.0004 0.0002 0.00017

→half modules fairly close everywhere, but T1UQ0M0

T1X1: Q1 is drifting from Q3
